

THE WART-FREE PROTOCOL

A natural, step-by-step guide to clear skin — and keeping it that way

Welcome — read this first

If you're here, chances are you've already tried a few things. The freezing kit that stung and came back. The acid that you were scared to put near healthy skin. Maybe a doctor's visit, maybe an oil that did nothing for weeks.

So let's be honest with you from the start: **this is not an overnight miracle**. Anyone who promises that is lying — and it's exactly why most wart products disappoint.

What *is* different is this: with the right routine, **you won't be guessing in the dark for three months**. You'll see your wart change, step by step — darken, dry, and lift away — so you always know it's working. That visibility is the whole point. This guide shows you exactly how to get there, gently, and how to keep it from coming back.

How it works (the simple version)

Tea tree oil (*Melaleuca alternifolia*) has been used on skin for generations. It works **on the surface**, without freezing or burning the healthy skin around the wart — which is why it's gentle enough for delicate areas and for kids 4+.

The key isn't brute force. It's **consistency + a little prep**, so the oil can reach where it needs to and your skin does the rest over time.

What you'll need (all in your kit)

1. **Kalmely Tea Tree Oil** — the active.
 2. **The precision applicator** — to place the oil *only* on the wart, never the healthy skin around it.
 3. **The prep file** — to gently soften the top layer so the oil absorbs.
 4. **The invisible patches** — to cover, protect, and keep the area clean between applications.
-
-

The Protocol — step by step

Do this 2–3 times a day. The whole thing takes under a minute.

1. **PREP** — Wash and dry the area. Once every couple of days, *gently* file the surface of the wart with the prep file (just a few light passes — never until it hurts or bleeds).
 2. **APPLY** — Dip the precision applicator and place 1 drop directly **on the wart only**. Let it absorb for a minute. (Keeping it off the healthy skin is what prevents irritation.)
 3. **PROTECT** — Cover with an invisible patch. It keeps the oil working, hides the wart, and helps stop it spreading by touch.
 4. **REPEAT** — Morning, (midday), and night. Consistency beats intensity every time.
-
-

What to expect — the visible timeline

Every wart and every person is different, but here's the typical arc so you know you're on track:

- **Days 1–3:** the wart often starts to **darken** — your first sign it's responding.
- **Week 1–2:** it begins to **dry out** and look smaller or flatter.
- **Week 2–4+:** the dried tissue **lifts and falls away**, revealing fresh skin underneath.

Older or plantar (foot) warts can take longer — patience here is your friend, not a fast hand. If you're tempted to pick or force it, don't: let it come away on its own.

By wart type

- **Hands & fingers:** the most common. Follow the protocol; the patch also helps with the self-consciousness while you wait.

- **Plantar (feet):** these are stubborn and deep. The prep file matters most here — soften before every couple of applications, and give it more weeks.
 - **Face & neck:** go gentle. Apply with the precision tip, keep it off surrounding skin, skip the filing in delicate areas.
 - **Kids (4+):** no stinging, no holding them down. A drop at bedtime and a patch they can keep on. Always supervise.
-
-

The Anti-Recurrence Protocol (so it doesn't come back)

Warts are caused by a virus, so the goal isn't just to remove the bump — it's to stop a comeback.

1. **Keep going for 1 extra week** after the wart looks gone. This is the step most people skip — and why warts return.
 2. **Don't share** towels, files, or socks while treating.
 3. **Don't pick or scratch** — it's the #1 way warts spread to new spots.
 4. **Keep skin dry and clean**, especially feet.
-
-

When to see a doctor

Please skip this guide and consult a professional if:

- You're **not sure it's a wart** (any mole or growth that changes color, shape, or bleeds).
- The area is **very painful, bleeding, or rapidly spreading**.
- You have **diabetes, poor circulation, or a weakened immune system**.
- It's on the **genitals or face near the eyes**.
- There's **no change after several weeks** of consistent use.

Your health comes first — always.

A final word

Clear skin is a process, not a magic trick — and now you have the full method, not just a bottle. Be consistent, be patient, and watch it work.

You've got this.
